

Latest on LHC heavy ion collimation

- Loss maps for several scenarios
- Suggested locations for BLMs (IR7)
- What next

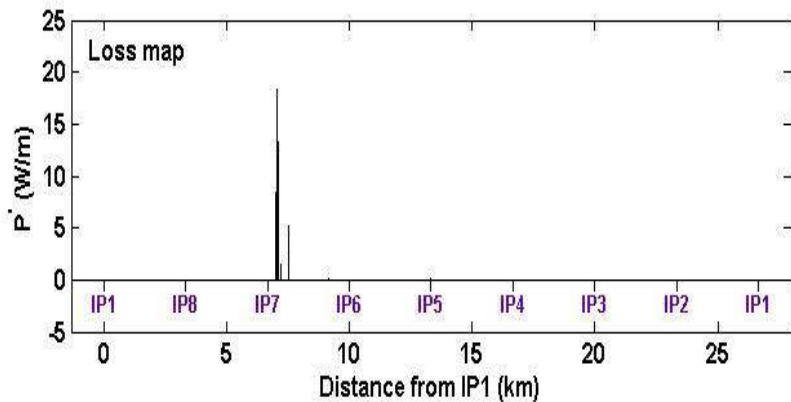

Beam1 @ nominal collision

Losses confined to IR7 dispersion suppressor, cells 9 & 11

Few small losses in IR2 (mainly blocked by tertiaries)

Beam2 @ nominal collision

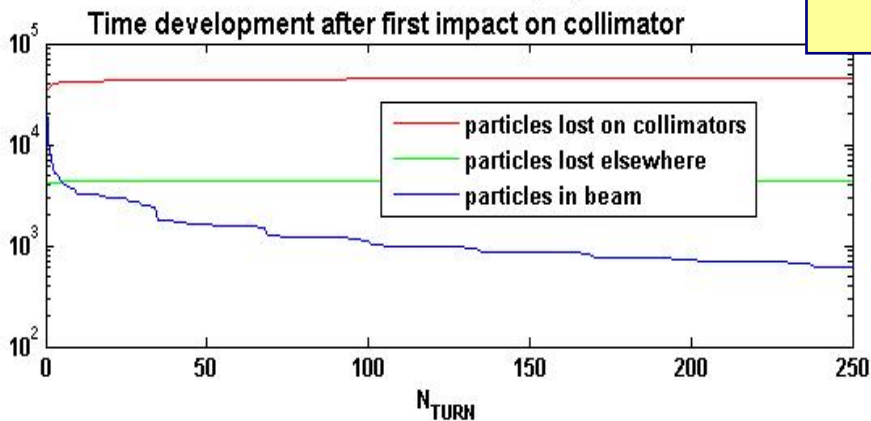

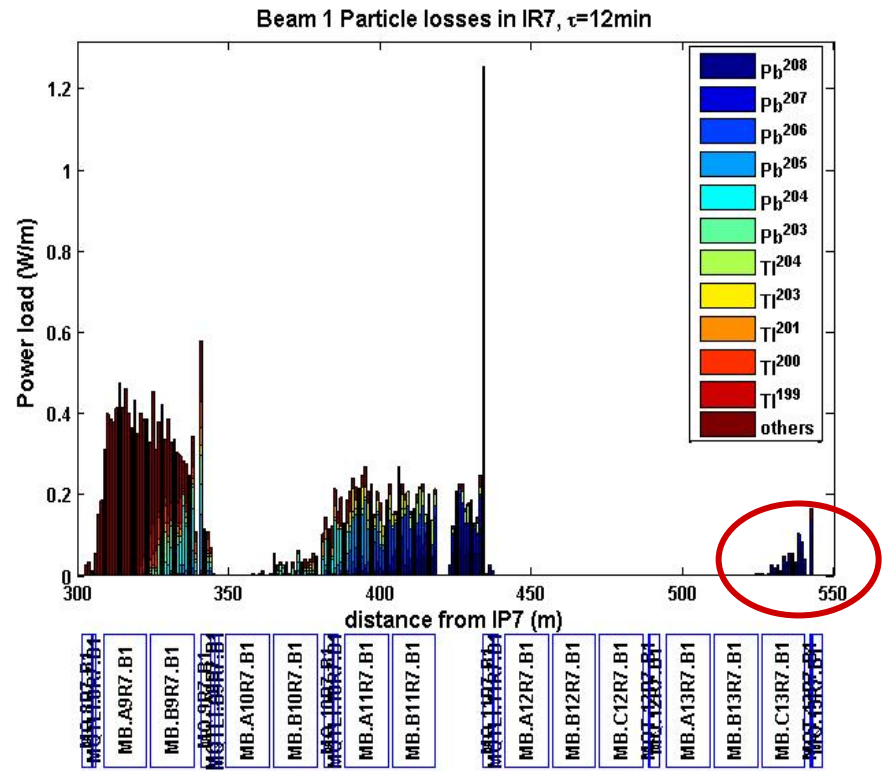

Beam 2 @ collision Particle losses in IR7, $\tau=12$ min

Beam 2 @ collision Particle losses in IR7, $\tau=12$ min

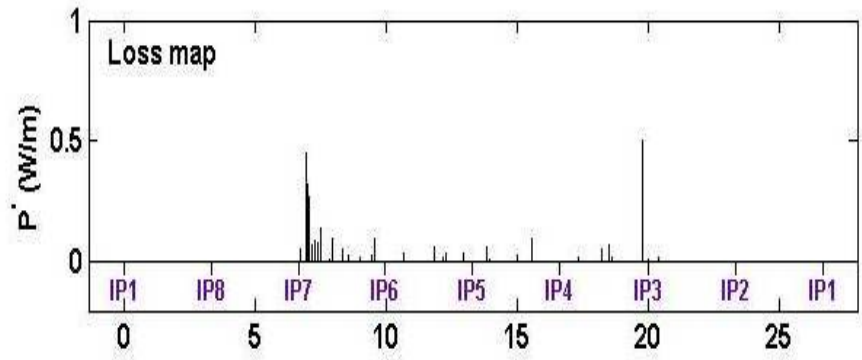

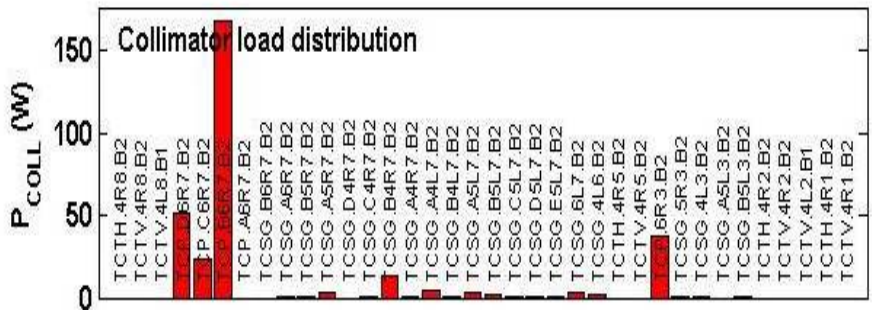

Beam1 @ injection

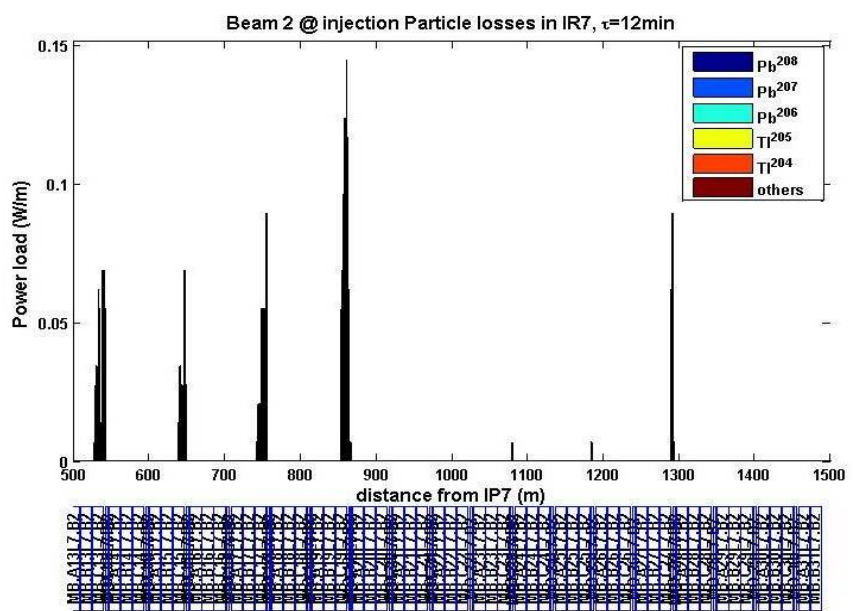

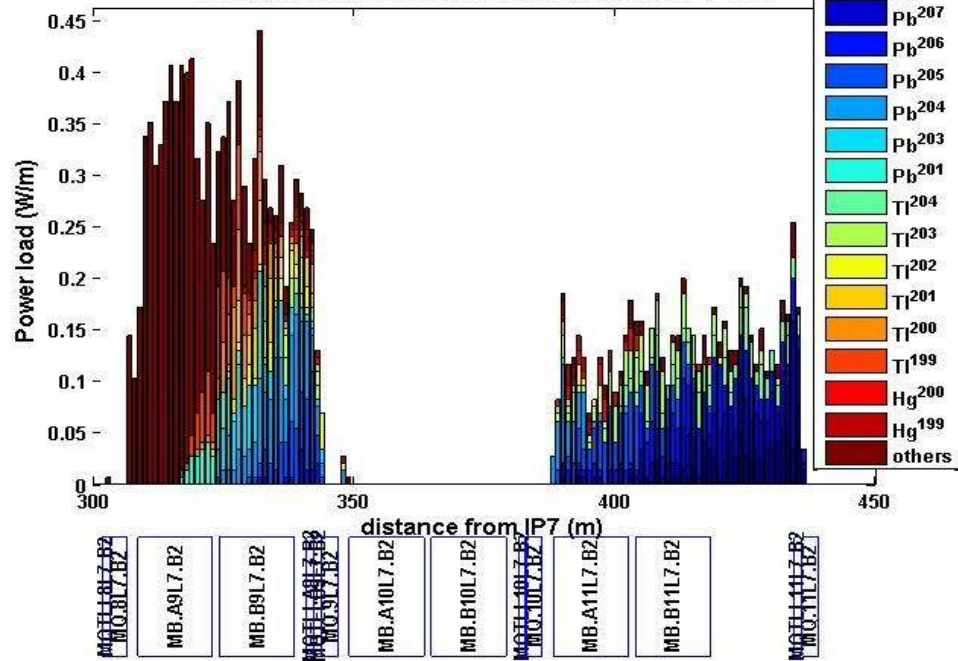

$\eta=0.0964$

Beam 2 @ injection

Beam 2 @ injection Particle losses in IR7, $t=12$ min

Status of LHC heavy ion collimation

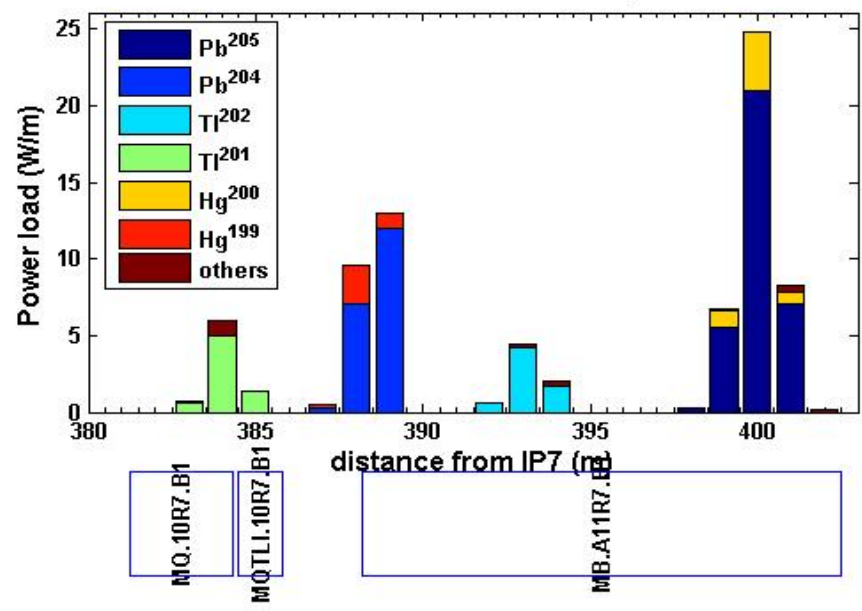

- Loss maps for several scenarios
- Suggested locations for BLMs (IR7)
- What next

Aperture sensitivity :

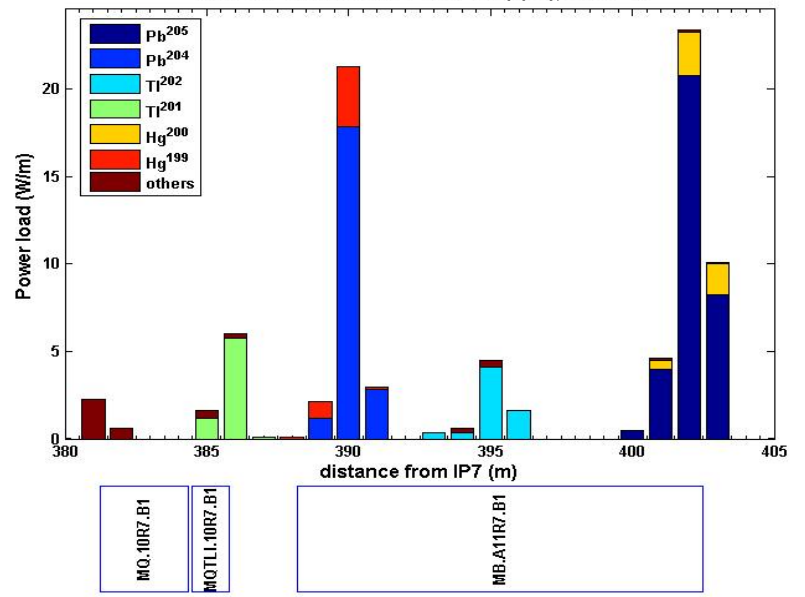

nominal

+1 mm

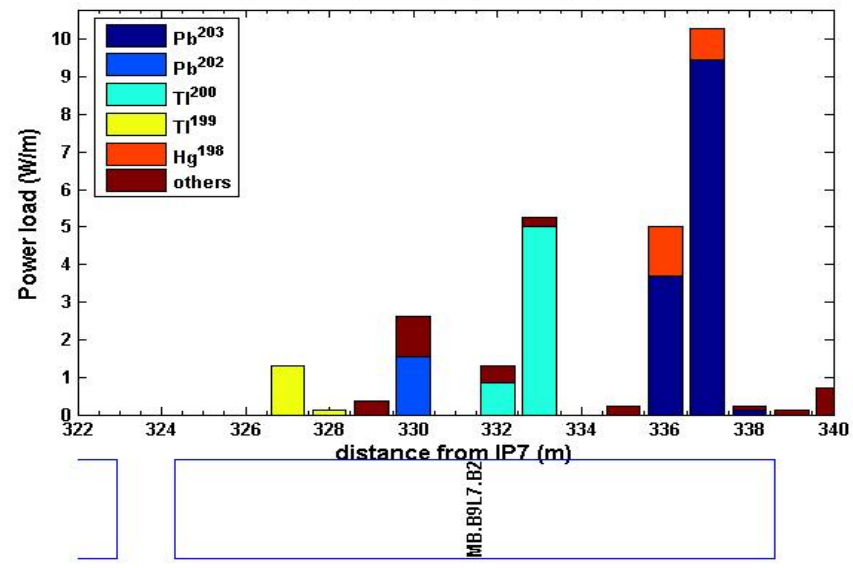

Beam 1 Particle losses in IR7 DS, $\tau=12\text{min}$

Beam 1 Particle losses in IR7 DS (ap +), $\tau=12\text{min}$

Beam 2 Particle losses in IR7 DS, $\tau=12\text{min}$

Beam 2 Particle losses in IR7 DS (ap +), $\tau=12\text{min}$

BLMs coverage:

Philosophy :

Adding 1mm to aperture (all elements) causes a shift in the beam loss peaks by up to 2m

BLMs coverage of IR7:

3 patches available in cells 8,9,11 (dipoles) X 8 channels (max) X 2 BLMs

2 channels available on quad patches (regions 8,9,10,11,13)

Need partial coverage of cell 9 and 13, full coverage of cell 11

Numbers:

BLM active length = 40 cm

Dipole length = 14.3 m (x2)

Long. Spread of energy deposition=

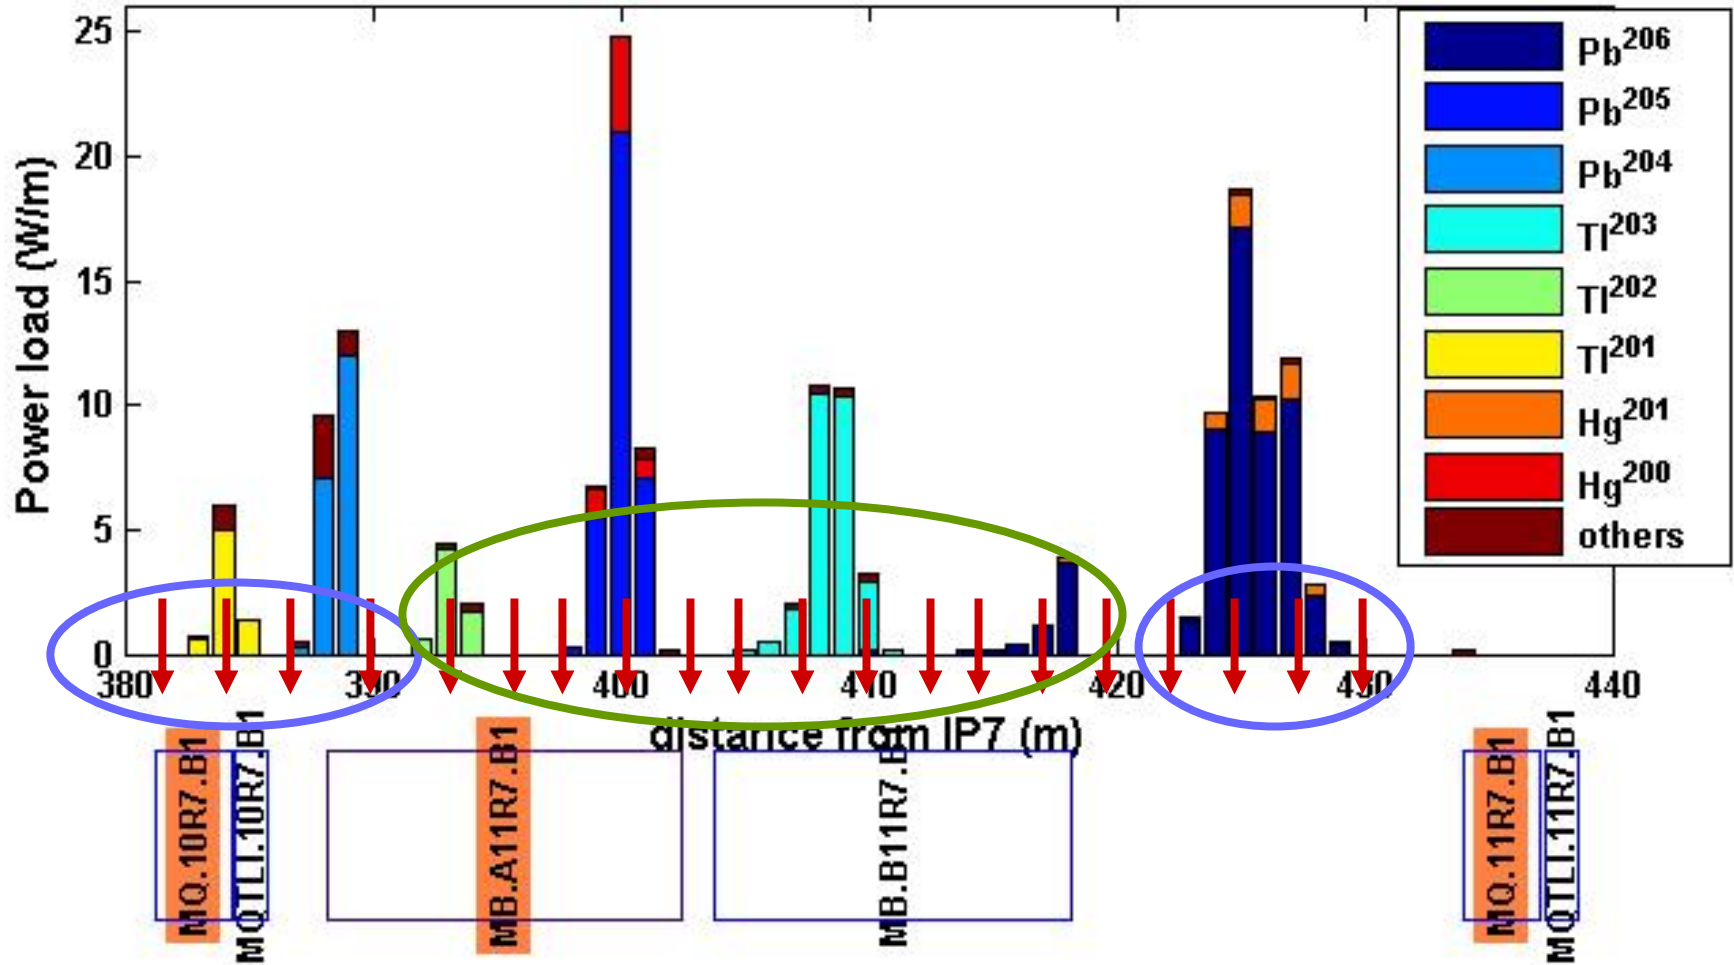

2.5 m FWHM

peak @ 1.5 m from impact

For coil deposition peak @ 30cm from
impact point

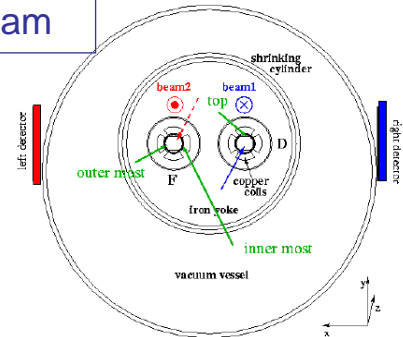

Beam 1 @ collision Particle losses in IR7, $\tau=12\text{min}$

B. Dehning's team

-2.5 m spacing

-Transverse position: inside (left) for beam2, outside (right) for beam1

What next ?

High priority:

#1 : Produce list of locations for BLM installation in IR7/IR3

2 : Study sensitivity to orbit oscillations using same perturbation model as used by proton collimation group (GRD's talk at last Chamonix)

Suggestions from CWG meeting:

Study loss distributions (uniform loss assumption vs losses concentrated on a single collimator jaw). Role of skew collimators?

Sample MAD optics every 10cm to get more precise loss locations.

Include a $\Delta p/p$ in initial distribution.

Study collimation inefficiency for thinner collimators.

Specific issues:

- Code benchmarking for protons (ICOSIM/Sixtrack, ICOSIM/SPS data)
- Improve physical model of particle/collimator interactions
