LCU Meeting

# SLHC: Beam-Beam contribution to DA

Emanuele Laface

with the fundamental contribution of  
Stephane Fartoukh  
Werner Herr  
Bernhard Holzer  
Frank Schmidt

# Parameters Considered

Nominal

$$Q_x = 64.31 \quad Q_y = 59.32 \quad DQ = 2$$

	$\beta^*$ [m]	Separation [ $\sigma$ ]	Crossing Angle [ $\mu$ rad]
IP1	0.55	0	285
IP2	10	5	480 (340 external)
IP5	0.55	0	285
IP8	10	0	610 (340 external)

3 Head-on + Halo collision in Alice

15 parasitic encounters per side in IR1 and IR5 before D1.

15 parasitic encounters per side in IR2 and IR8 before D1.

No magnet errors.

# Parameters Considered

SLHC

$$Q_x = 63.31 \quad Q_y = 60.32 \quad DQ = 2$$

	$\beta^*$ [m]	Separation [ $\sigma$ ]	Crossing Angle [ $\mu$ rad]
IP1	0.30	0	410
IP2	10	5	480 (340 external)
IP5	0.30	0	410
IP8	10	0	610 (340 external)

3 Head-on + Halo collision in Alice

19 parasitic encounters per side in IR1 and IR5 before D1.

15 parasitic encounters per side in IR2 and IR8 before D1.

No magnet errors.

# Parameters Considered

## SLHC

$$Q_x = 63.31 \quad Q_y = 60.32 \quad DQ = 2$$

	$\beta^*$ [m]	Separation [ $\sigma$ ]	Crossing Angle [ $\mu$ rad]
IP1	0.30	0	410
IP2	10	5	480 (340 external)
IP5	0.30	0	410
IP8	10	0	610 (340 external)

3 Head-on + Halo collision in Alice

19 parasitic encounters per side in IR1 and IR5 before D1.

15 parasitic encounters per side in IR2 and IR8 before D1.

No magnet errors.

# Parameters Considered

## SLHC

$$Q_x = 63.31 \quad Q_y = 60.32 \quad DQ = 2$$

There are two switches:

	$\beta^*$ [m]	Separation [ $\sigma$ ]	Crossing Angle [ $\mu$ rad]
IP1	10	0	610 (340 external)
IP2	10	0	610 (340 external)
IP3	10	0	610 (340 external)
IP5	10	0	610 (340 external)
IP7	10	0	610 (340 external)
IP8	10	0	610 (340 external)

The ON\_BETABEAT can switch on or off the off-momentum beta-beating correction in IP1, IP3, IP5 and IP7. When the switch is off the sextupoles are used only for Q' correction (same strength for all sextupoles family).

The ON\_QPP can be used to correct the residual second order chromaticity with octupoles. This works only when beta-beating is corrected, otherwise the second order chromaticity is too big and it is not possible to correct.

# Vertical Distance IP1

○ SLHC ○ Nominal

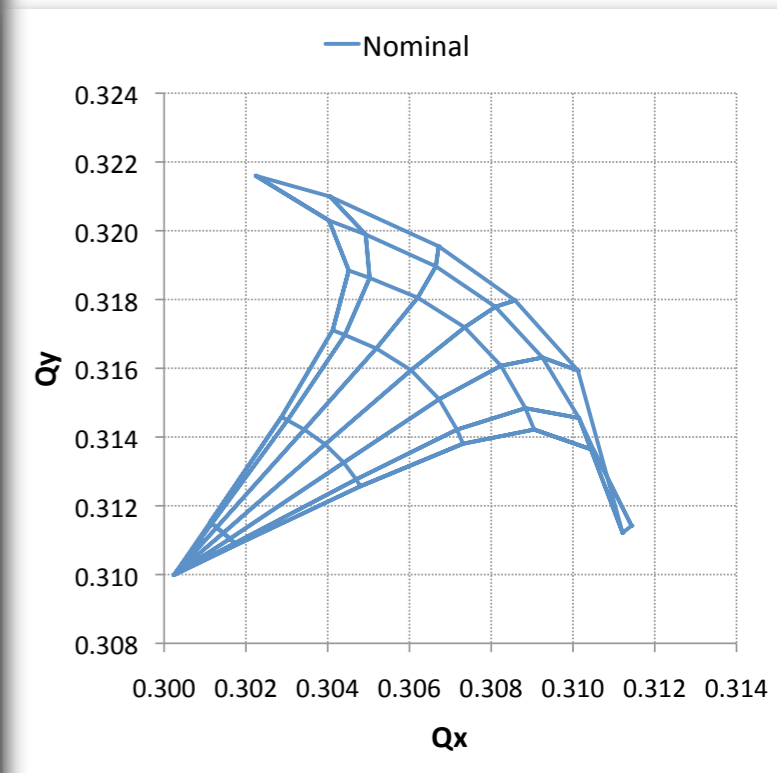

# Horizontal Distance IP5

○ SLHC ○ Nominal

# Nominal Optics

1.000.000 turns

# Nominal Optics

vs

# SLHC with Beta Beating Off and $Q''$ Off

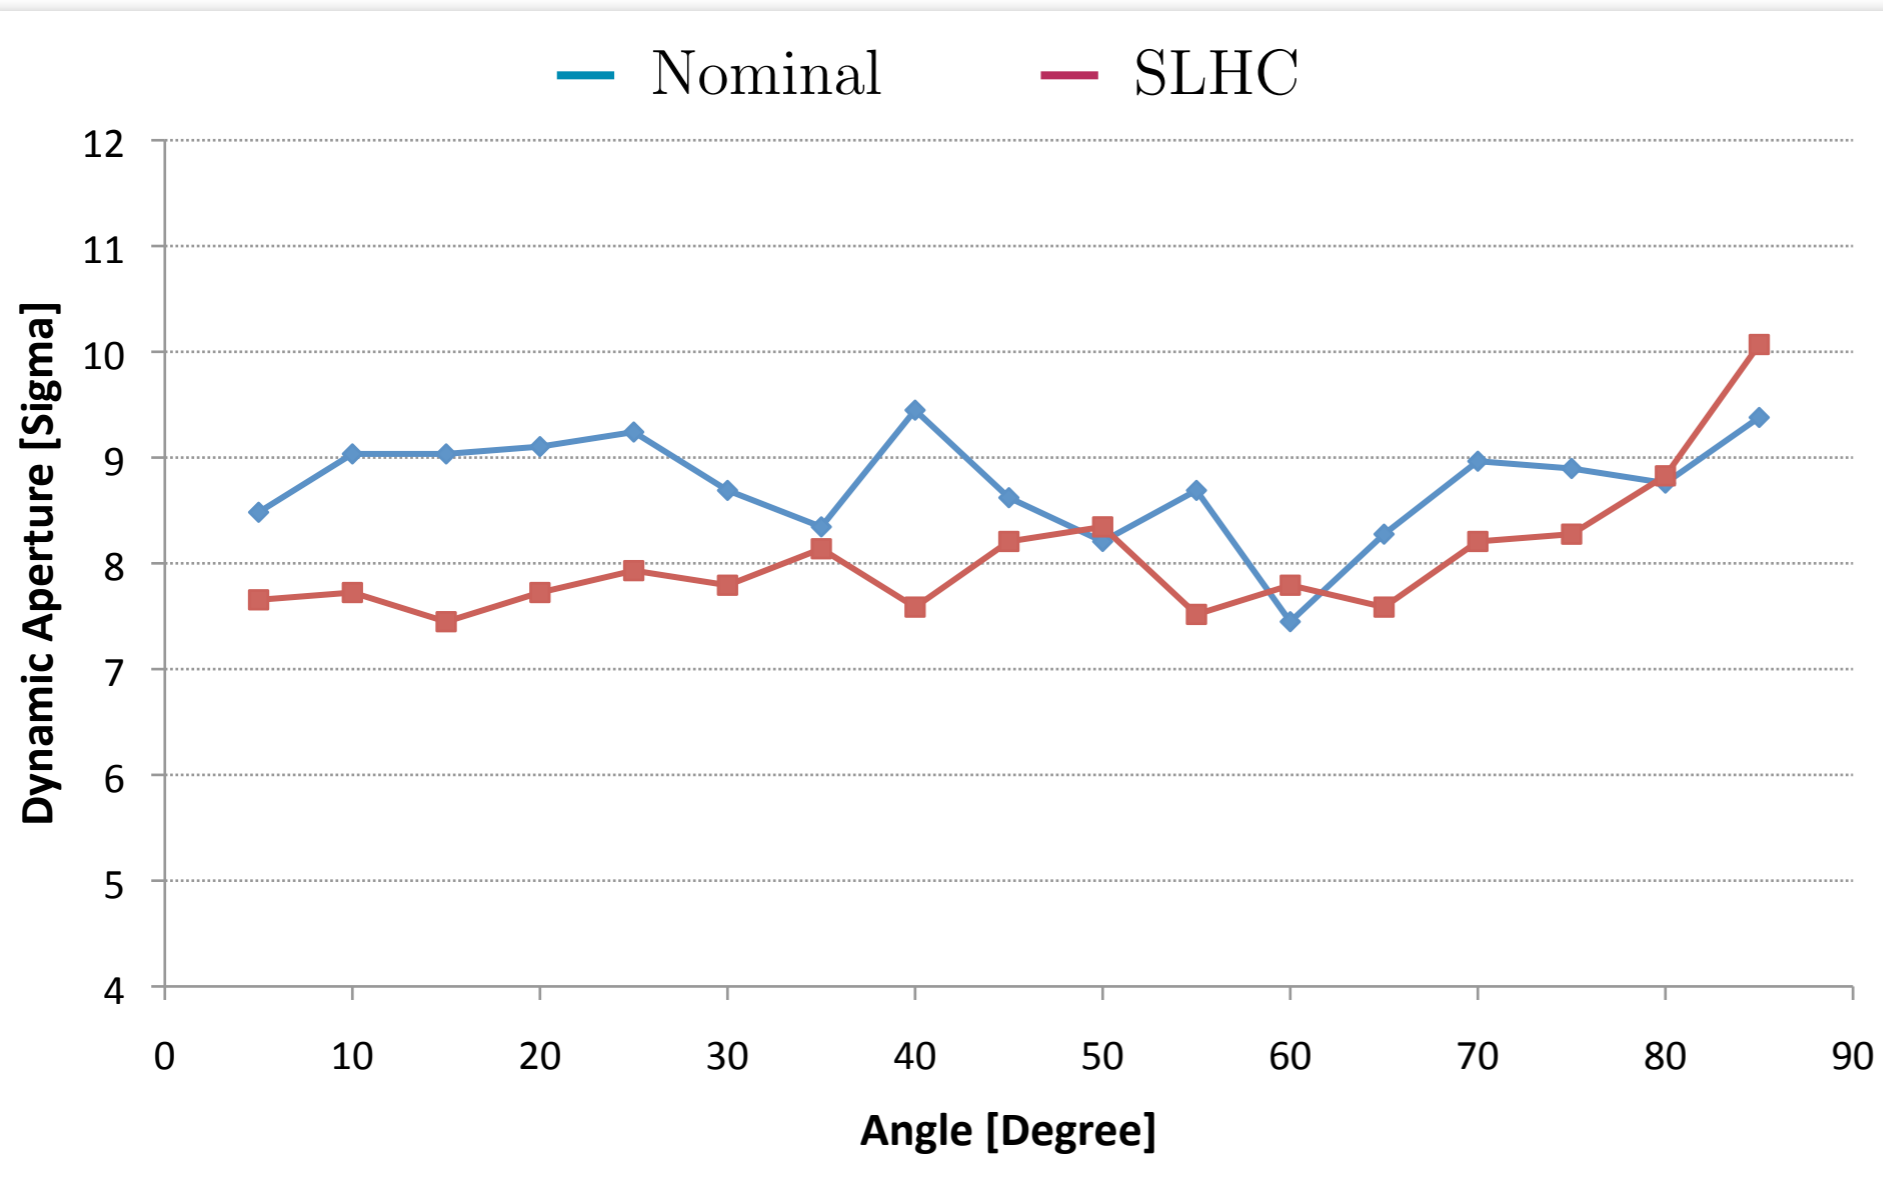

1.000.000 turns

# Nominal Optics

4 parasitic encounters reduce the DA more than  $1\sigma$  even if the separation is in general better for SLHC than the nominal optics.

4 parasitic encounters reduce the DA more than  $1\sigma$  even if the separation is in general better for SLHC than the nominal optics.

But why when I remove the 4 parasitic encounters I don't find the nominal DA? The footprint is smaller and the separation is bigger! To be investigated (maybe a tunescan?).

4 parasitic encounters reduce the DA more than  $1\sigma$  even if the separation is in general better for SLHC than the nominal optics.

But why when I remove the 4 parasitic encounters I don't find the nominal DA? The footprint is smaller and the separation is bigger! To be investigated (maybe a tunescan?).

The strength of the octupoles used to correct  $Q''$  can be an issue for the DA.

4 parasitic encounters reduce the DA more than  $1\sigma$  even if the separation is in general better for SLHC than the nominal optics.

The strength of the octupoles used to correct  $Q''$  can be an issue for the DA.

What about the encounters in D1?

The separation is faster in SLHC because the new D1 is superconducting. To be investigated.

Beam-Beam + Magnet Errors.

Thank you.
