# Status of IR8 squeeze

Emanuele Laface

IR8 “official” squeeze shows four problems:

## IR8 “official” squeeze shows four problems:

- During the pre-squeeze the  $\beta^*$  is not constant at 10 m.

## IR8 “official” squeeze shows four problems:

- During the pre-squeeze the  $\beta^*$  is not constant at 10 m.
- During the pre-squeeze and the squeeze the tune is not constant.

## IR8 “official” squeeze shows four problems:

- During the pre-squeeze the  $\beta^*$  is not constant at 10 m.
- During the pre-squeeze and the squeeze the tune is not constant.
- The chromaticity is not the nominal one.

## IR8 “official” squeeze shows four problems:

- During the pre-squeeze the  $\beta^*$  is not constant at 10 m.
- During the pre-squeeze and the squeeze the tune is not constant.
- The chromaticity is not the nominal one.
  - The strength of some magnets changes in a way that, probably, is not tolerated by the magnet.

## After a new match:

- During the pre-squeeze the  $\beta^*$  is not constant at 10 m.
- During the pre-squeeze and the squeeze the tune is not constant.
- The chromaticity is not the nominal one.
- The strength of some magnets changes in a way that, probably, is not tolerated by the magnet.

## After a new match:

- ✓ - During the pre-squeeze the  $\beta^*$  is not constant at 10 m.
- During the pre-squeeze and the squeeze the tune is not constant.
- The chromaticity is not the nominal one.
- The strength of some magnets changes in a way that, probably, is not tolerated by the magnet.

## After a new match:

- ✓ - During the pre-squeeze the  $\beta^*$  is not constant at 10 m.
  - ✓ - During the pre-squeeze and the squeeze the tune is not constant.
  - The chromaticity is not the nominal one.
- The strength of some magnets changes in a
- way that, probably, is not tolerated by the magnet.

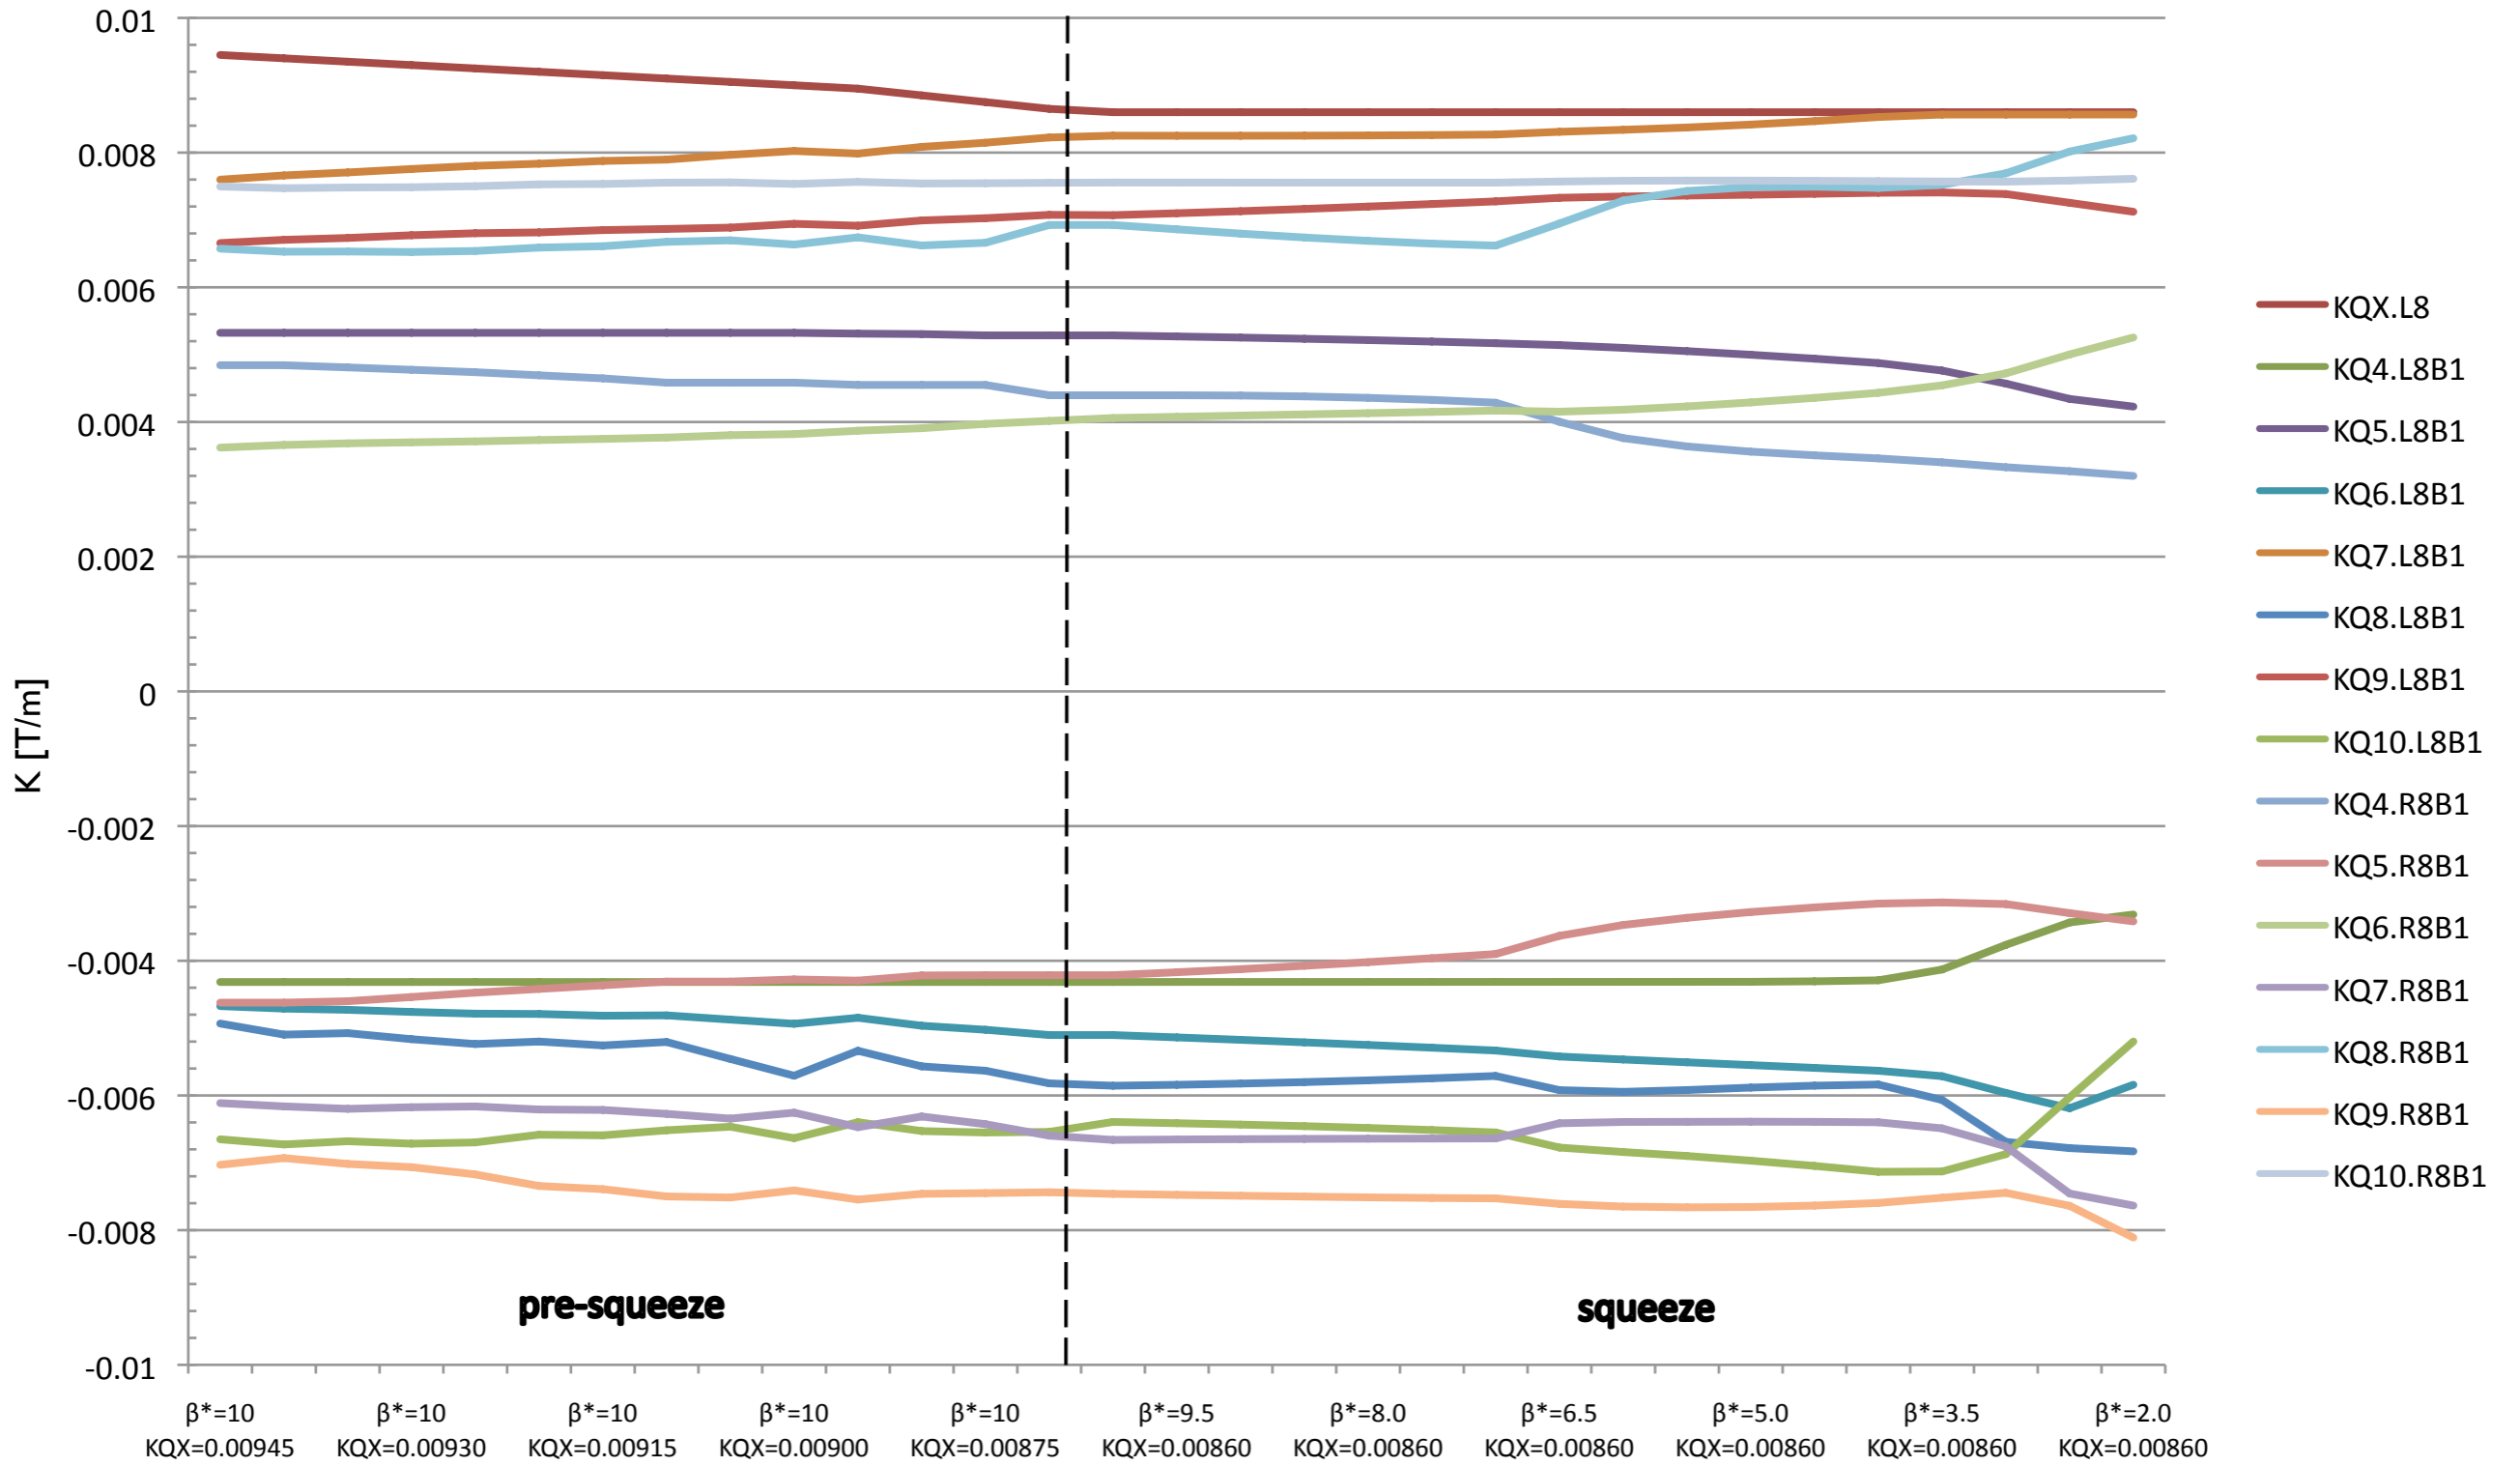

## After a new match:

- ✓ - During the pre-squeeze the  $\beta^*$  is not constant at 10 m.
- ✓ - During the pre-squeeze and the squeeze the tune is not constant.
- ✗ - The chromaticity is not the nominal one.  
The strength of some magnets changes in a way that, probably, is not tolerated by the magnet.

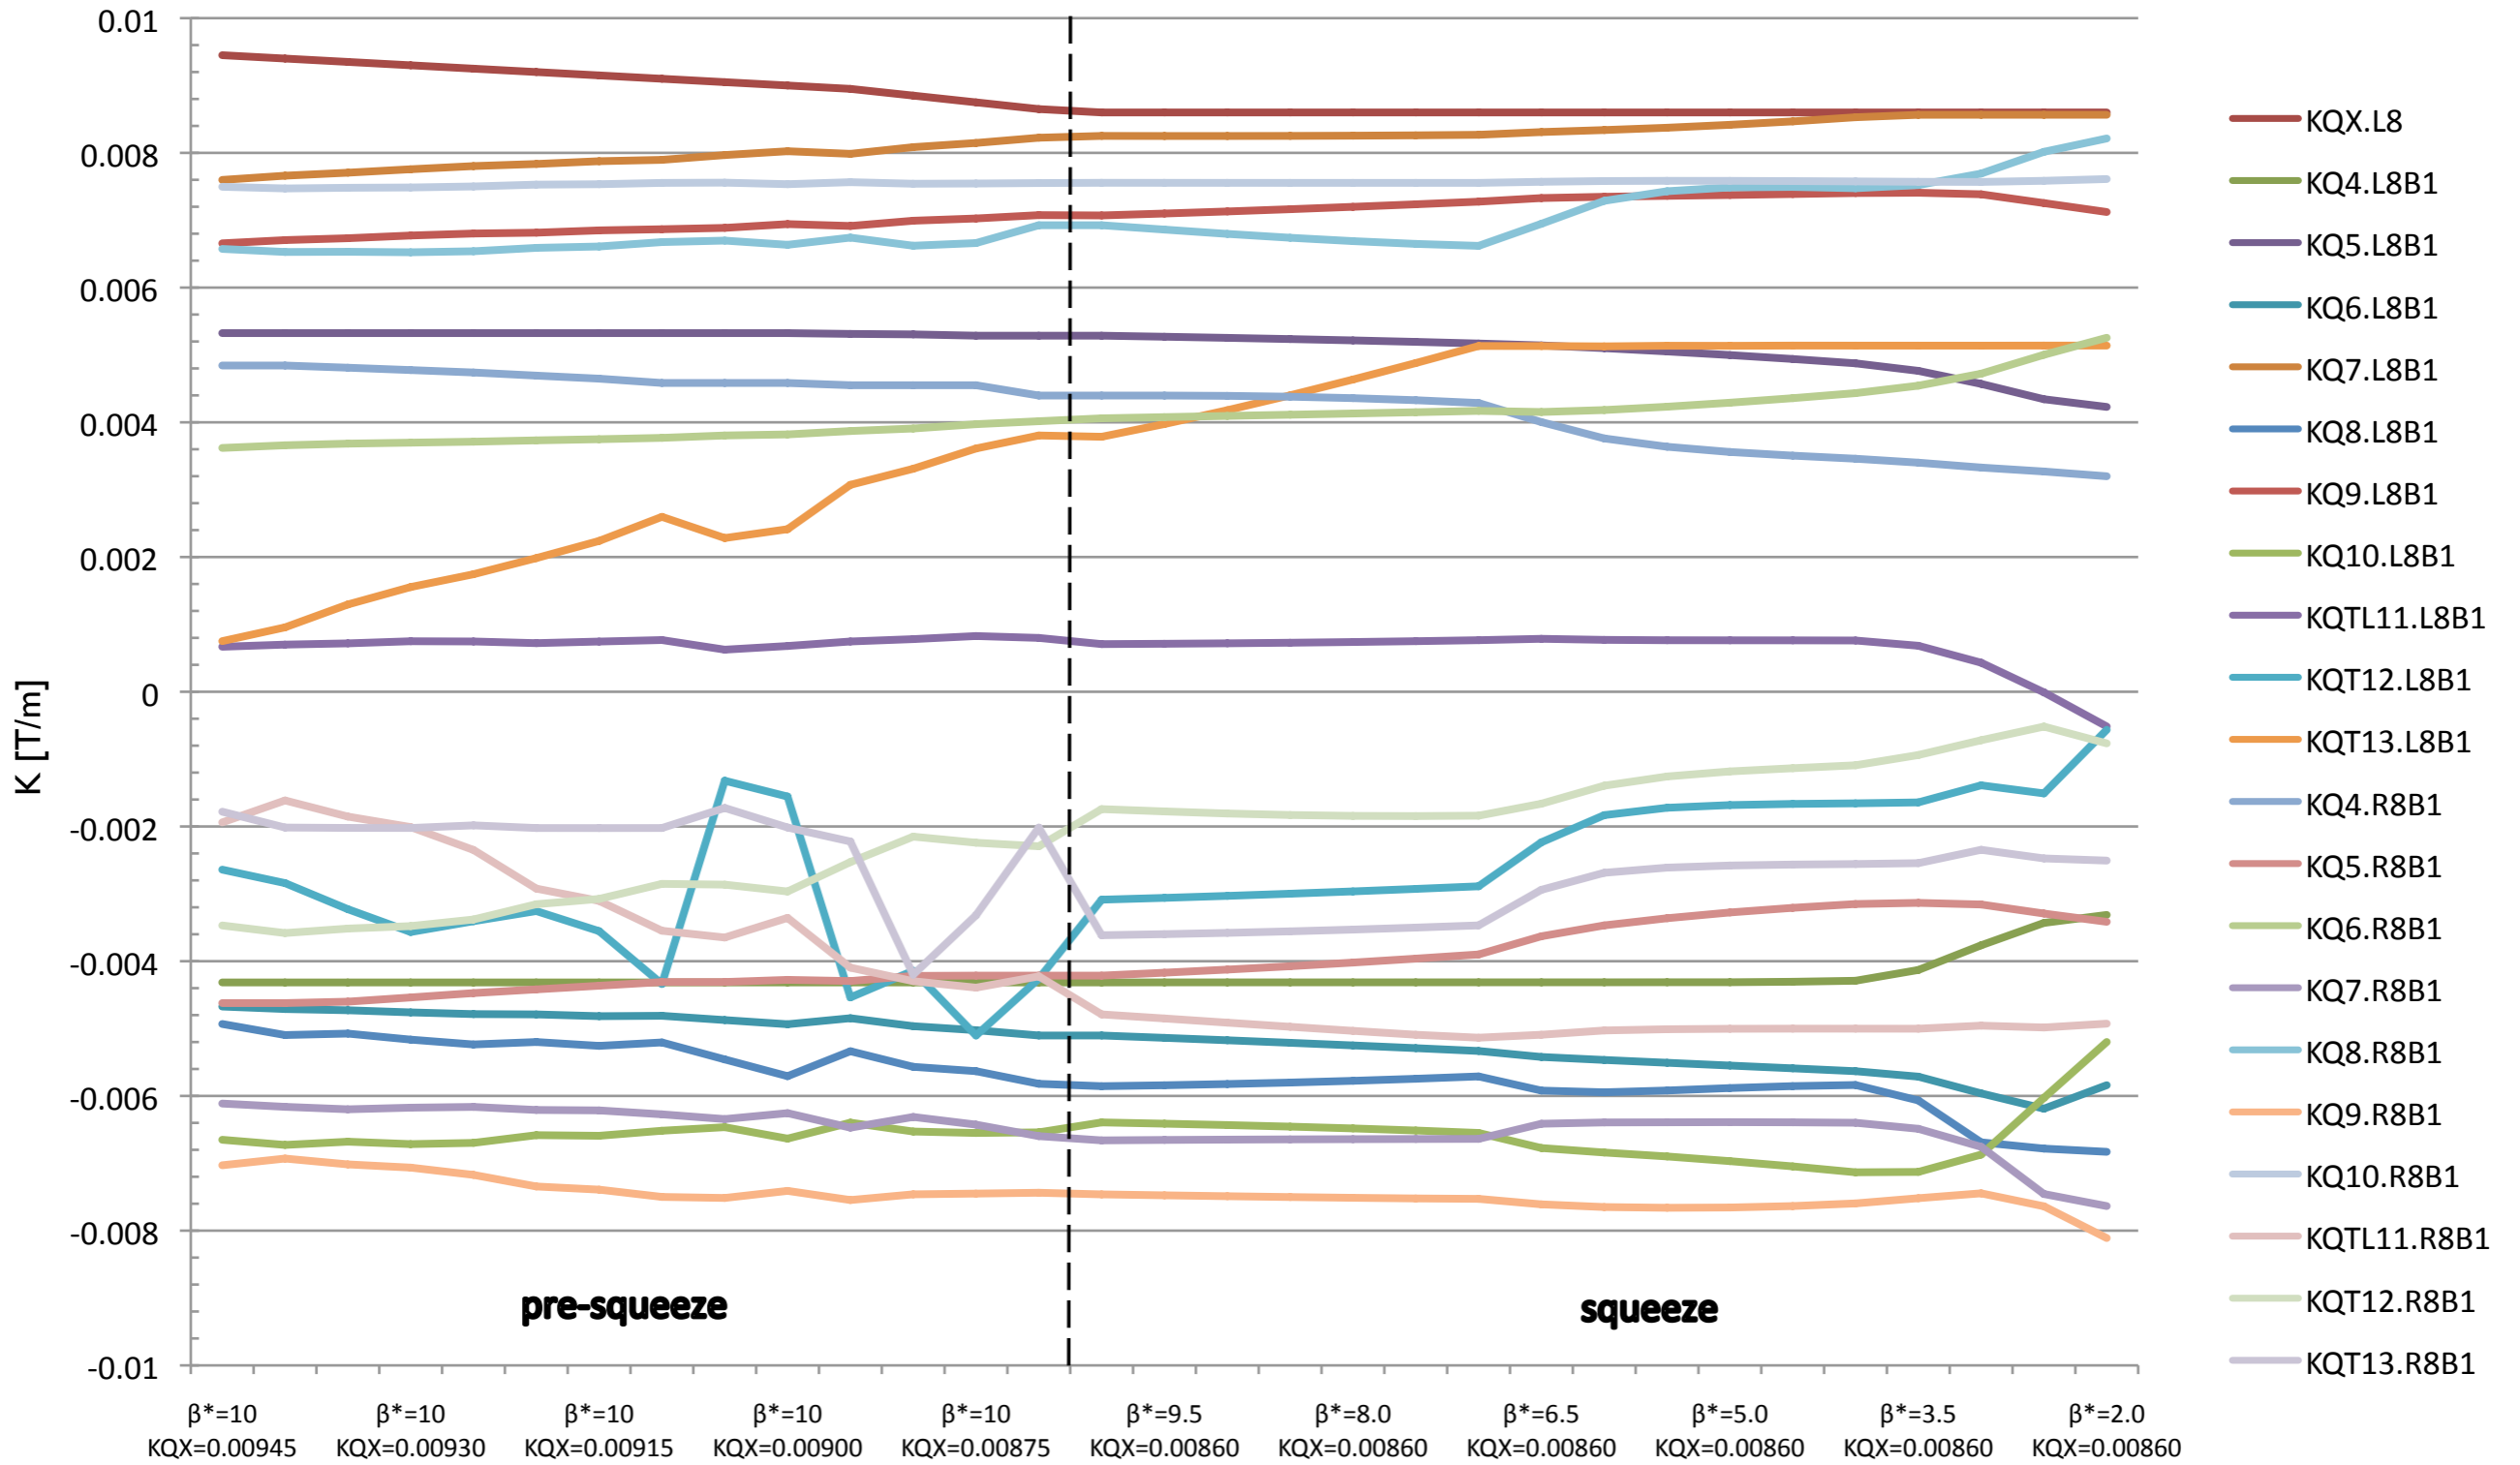

## After a new match:

- ✓ - During the pre-squeeze the  $\beta^*$  is not constant at 10 m.
- ✓ - During the pre-squeeze and the squeeze the tune is not constant.
- X - The chromaticity is not the nominal one.
- ✓ - The strength of some magnets changes in a way that, probably, is not tolerated by the magnet.

# Crossing

**Next step for IR8:**

## Next step for IR8:

Aperture analysis at injection with the LHCb spectrometer switched on and the new aperture model prepared by M. Giovannozzi.

Prepare a squeeze sequence for 3.5 TeV

The main difference is that at 3.5 TeV the strength of the triplet can be kept constant during all the squeeze, so no more pre-squeeze is required.
