Contents

- Flat beam optics. Comparison.
- Double half-quadrupole
- Crab waist collisions
- Luminosity increase
- Conclusions

Flat beam optics

Peak luminosity

$$L = \frac{N^2 n_b f}{4\pi\sigma_x\sigma_y} * F$$

Local chromatic correction in Y.
First time ever for LHC!

To increase luminosity:

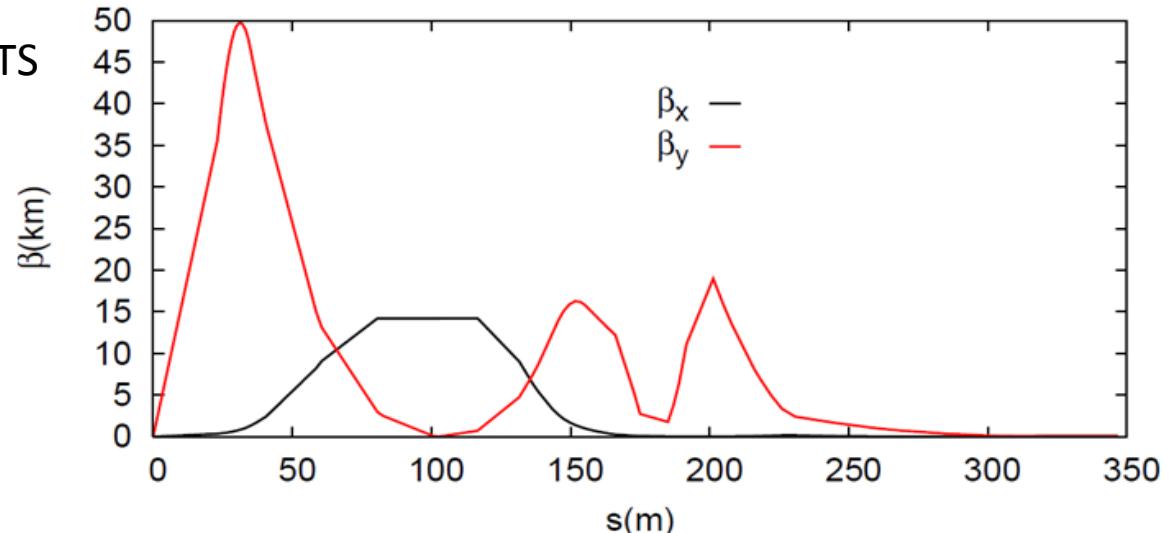

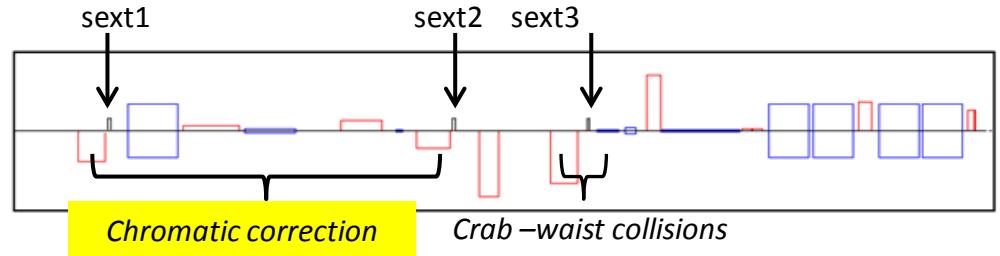

- Reduce both σ_x^* and σ_y^*
- Substantially reduce σ_y^*

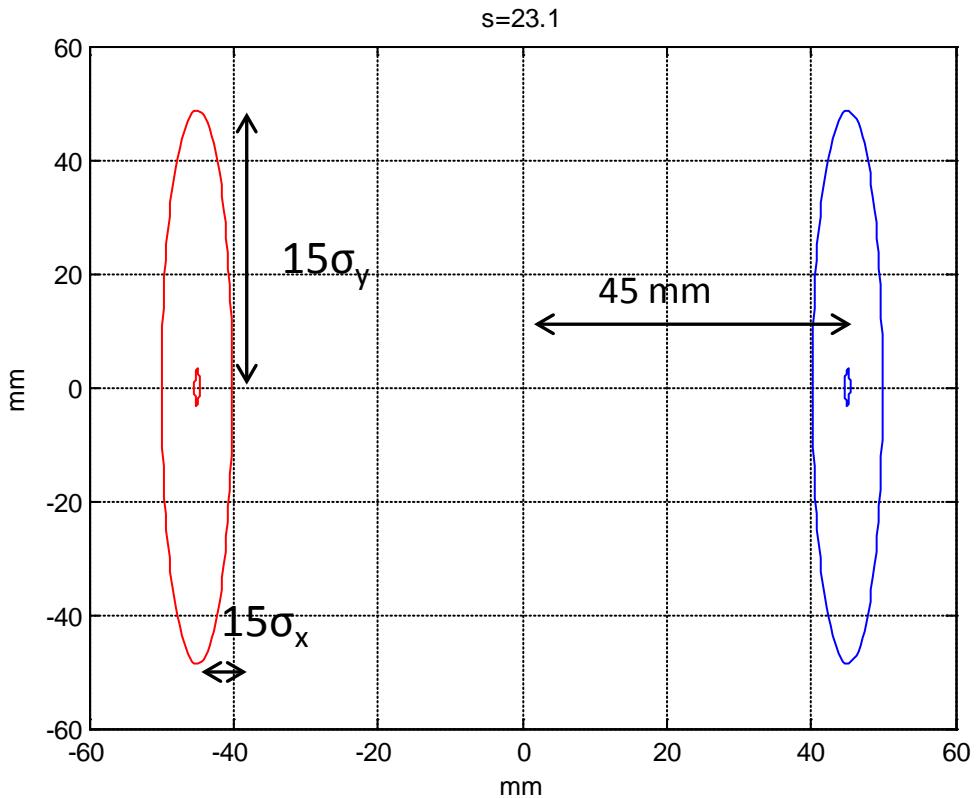

$$\beta_x^* = 1.5 \text{ m}$$

$$\beta_y^* = 1.5 \text{ cm}$$

$\beta_x^* \beta_y^* = 15 \text{ cm} \times 15 \text{ cm}$ (nominal ATS
optics with crab cavities)

	$\Delta\mu_x$	$\Delta\mu_y$
sext1	$\pi/2$	$\pi/2$
sext2	$\pi/2$	$3\pi/2$
sext3	π	$5\pi/2$

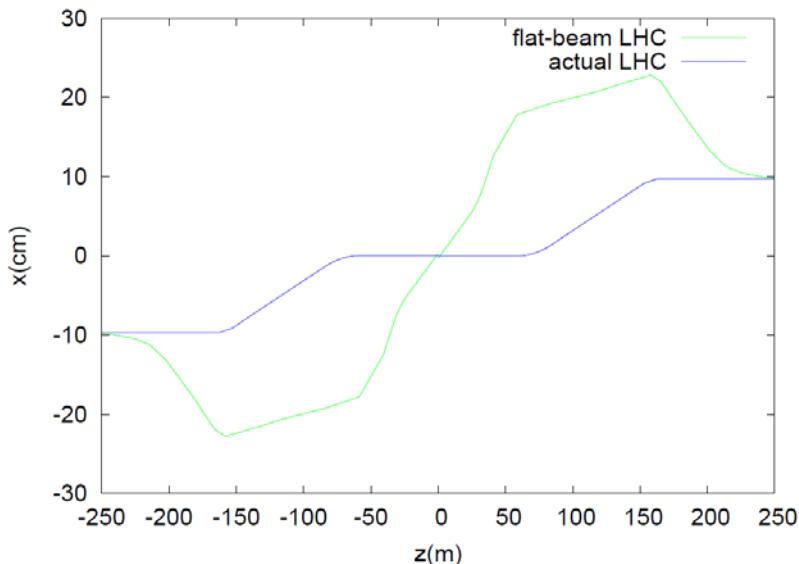

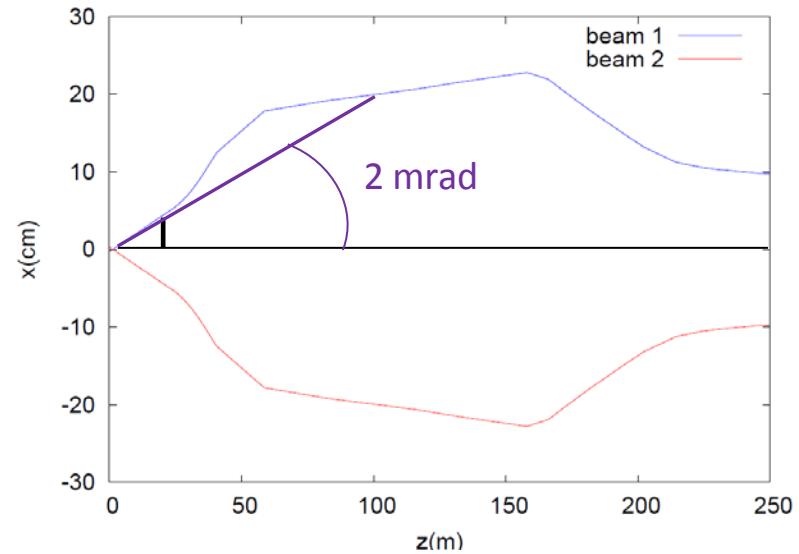

$$\sigma_x / \sigma_y = 10$$

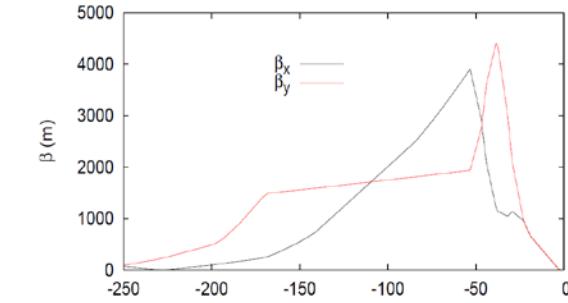

Minimum required according to
beam-beam simulations.

Large crossing angle \rightarrow large Piwinski angle

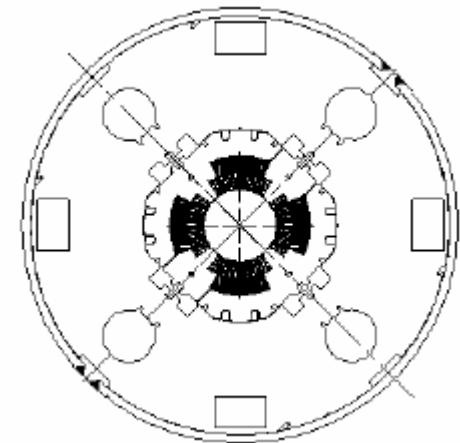

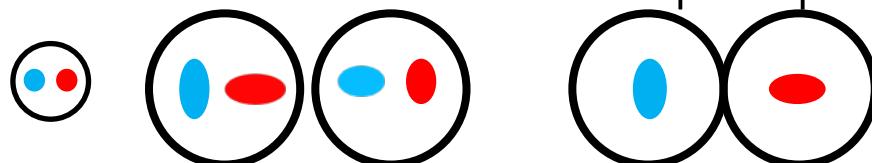

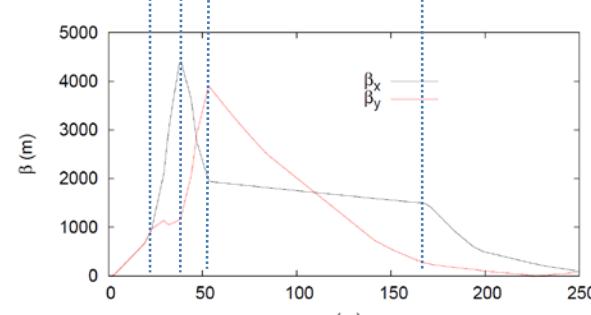

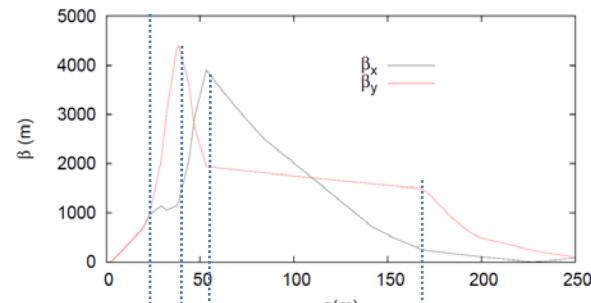

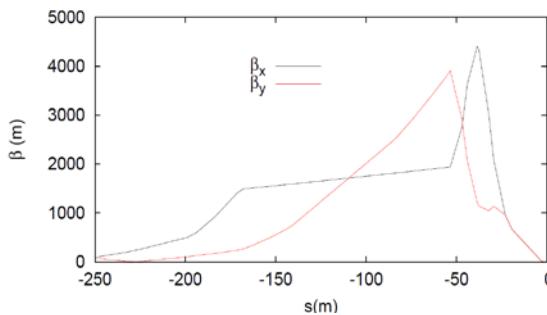

$$\phi = \frac{\theta \sigma_z}{2 \sigma_x}$$

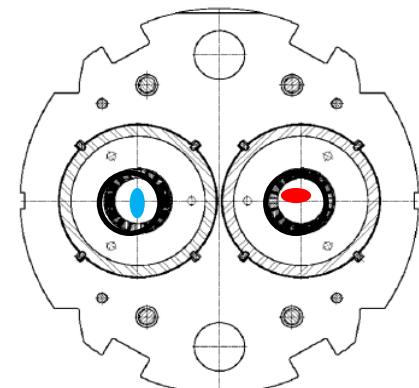

Actual LHC optics

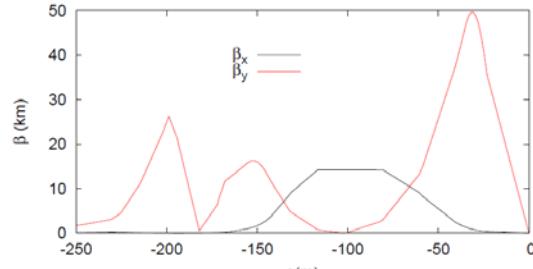

IP

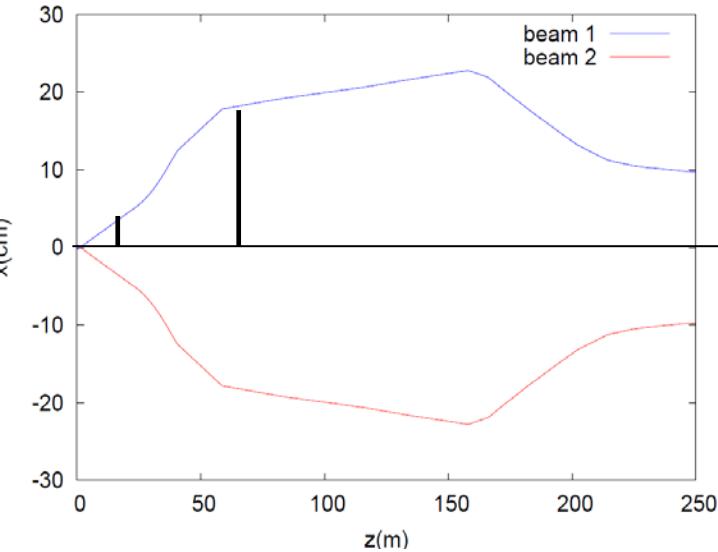

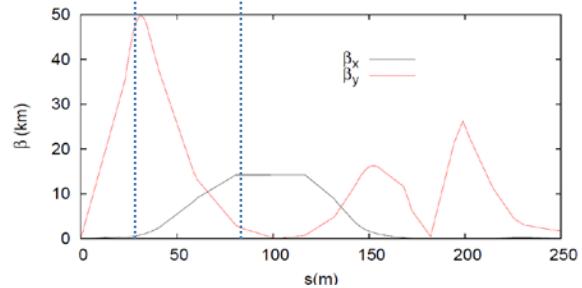

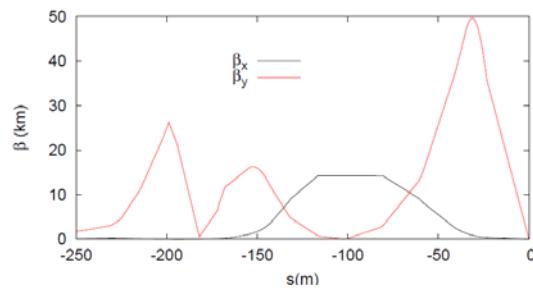

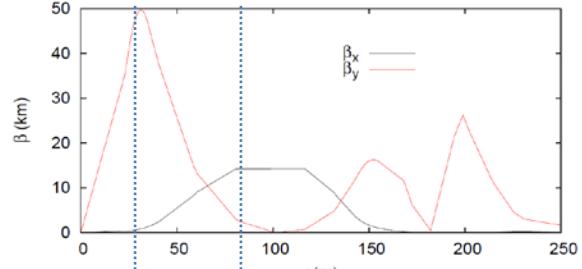

The 2 beams see
opposite gradients

Flat beam LHC optics

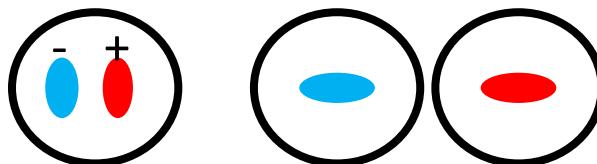

IP

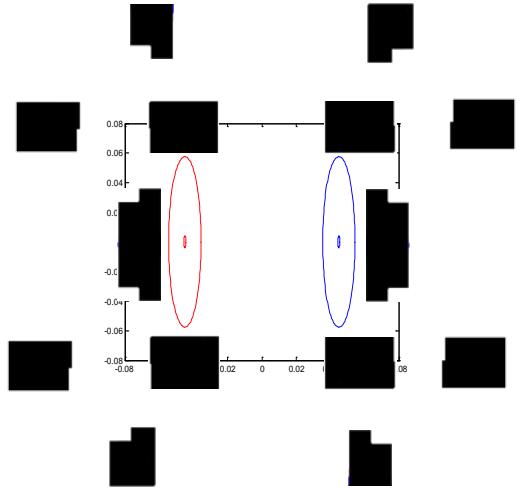

The 2 beams see the same gradients

How to produce opposite gradient in the same pipe?

Matching

Arc (MQ11)
 ↙

$\beta_x = 33 \text{ m}$
 $\beta_y = 184 \text{ m}$

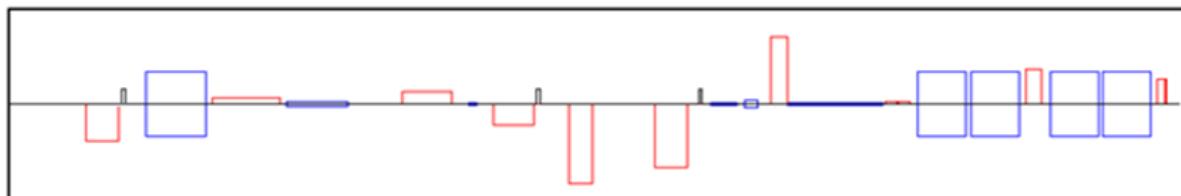

Arc (MQ11)
 ↗

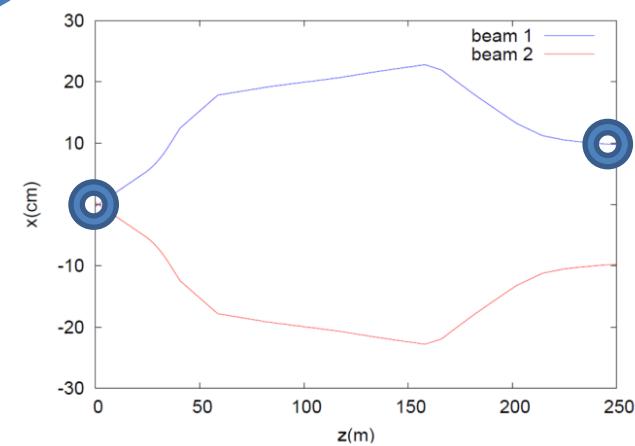

$\beta_x = 184 \text{ m}$
 $\beta_y = 33 \text{ m}$

Use of two different matching sections

FF MS DS

Dispersion matching $D(\text{sext2}), D(\text{sext3}), D(\text{IP})=0$
 with geometric constraints

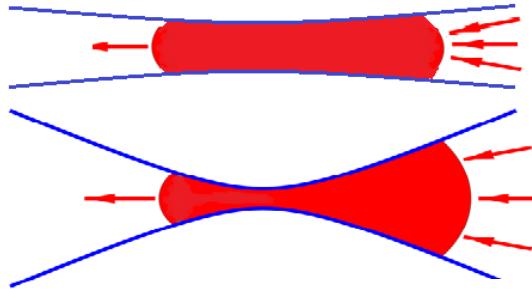

Large Piwinski angle

$$L \propto \frac{N\xi_y}{\beta_y}; \quad \xi_y \propto \frac{N\beta_y}{\sigma_x \sigma_y \sqrt{1+\phi^2}}; \quad \xi_x \propto \frac{N}{\varepsilon_x(1+\phi^2)}; \quad \phi = \frac{\theta \sigma_z}{2\sigma_x}$$

Luminosity reduction through F but...

1-Decrease overlapping area. Lower β_y decrease

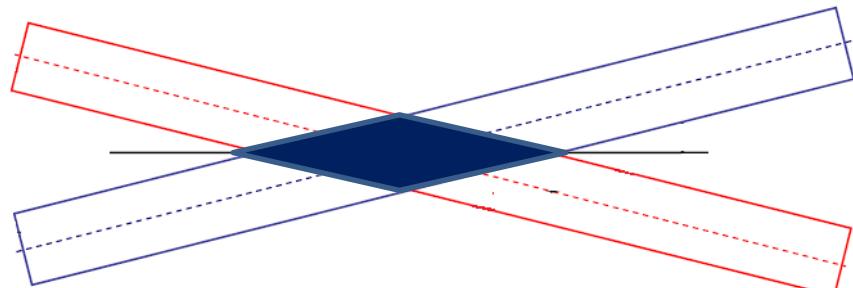

Hourglass effect limits β_y decrease $\beta_y > Area$

Head-on or small ϕ

$$Area \approx \sigma_z$$

Large Piwinski angle

$$Area \approx \frac{2\sigma_x}{\theta}$$

$$\frac{2\sigma_x}{\theta} \approx 1cm$$

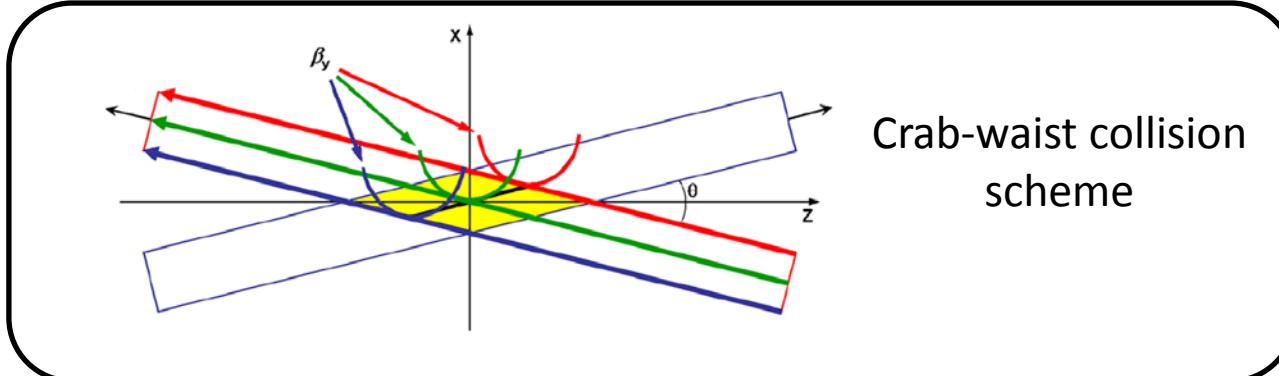

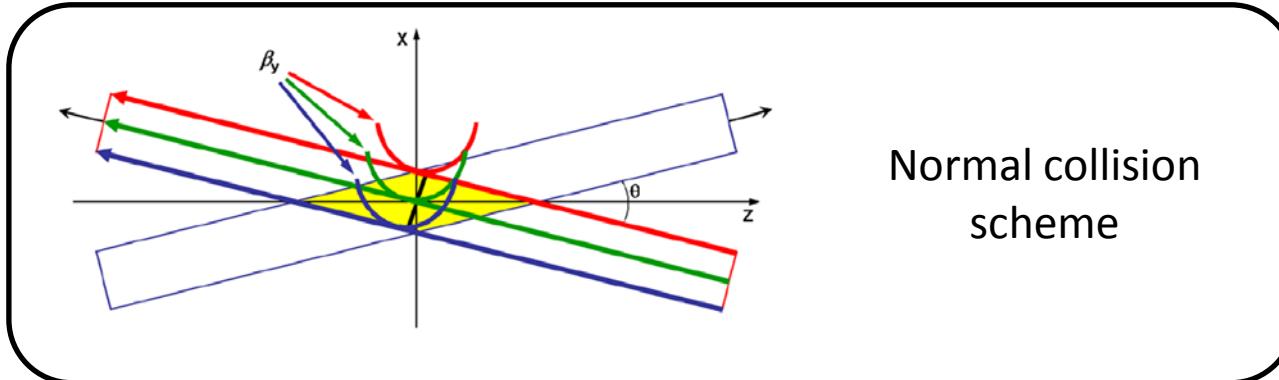

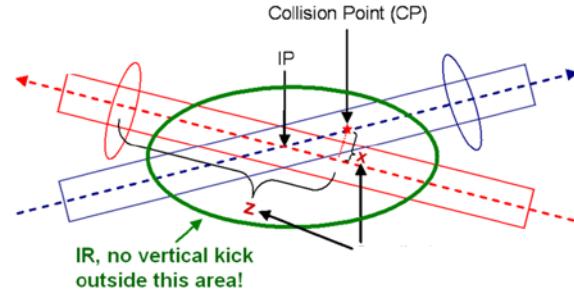

2-More particles N for the same beam-beam tune shift

3-It opens the possibility for **crab-waist** collisions

Crab-waist collisions

In Large Piwinski Angle
 Collision Point ≠ Interaction Point

Crab-waist collisions

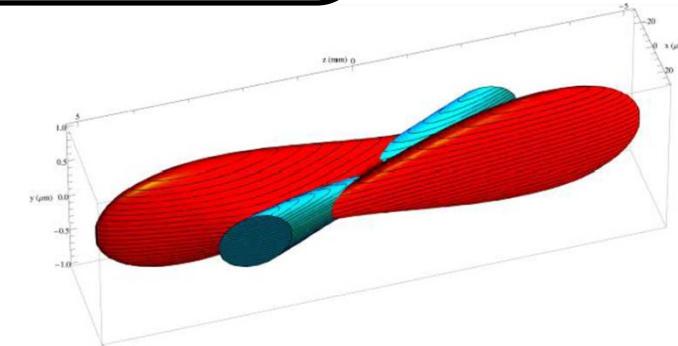

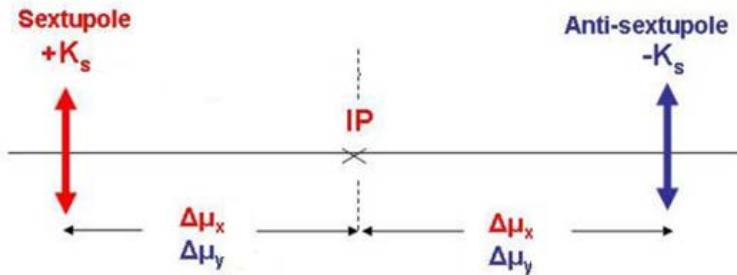

Conditions

$$\Delta\mu_x = \pi m$$

$$\Delta\mu_y = \frac{\pi}{2}(2n+1)$$

Sextupole strength

$$kl_s = \frac{\sqrt{\beta_x^*/\beta_x}}{\theta\beta_y^*\beta_y}$$

In particular

$$\Delta\mu_x = \pi$$

$$k_2 = 0.0313 m^{-3}$$

$$\Delta\mu_y = \frac{5\pi}{2}$$

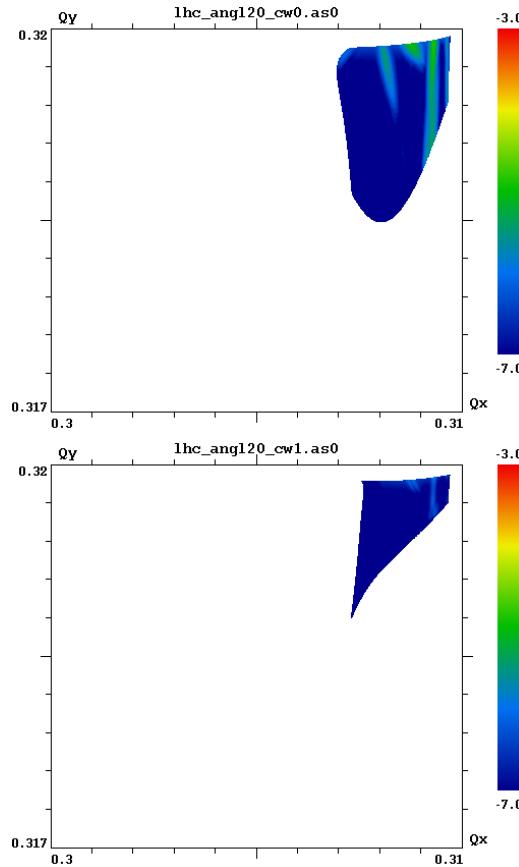

$$l_s = 8m$$

Crab-waist simulations

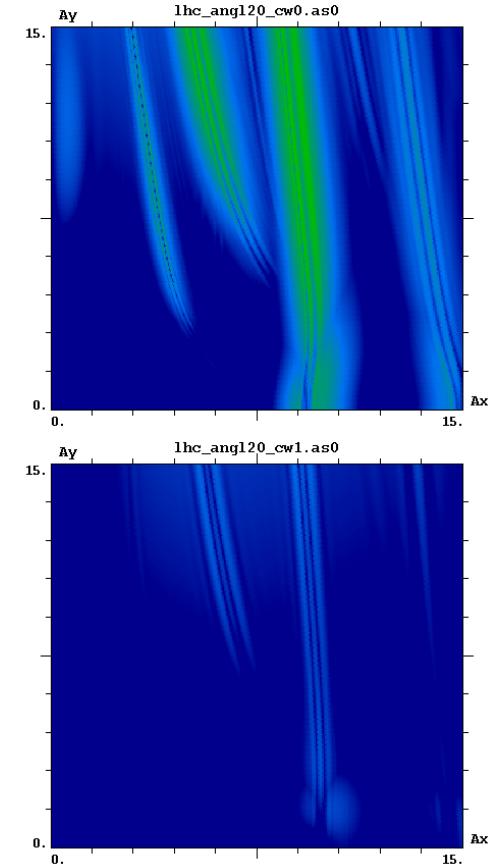

Resonance suppression

CW = 0

CW = 0.5

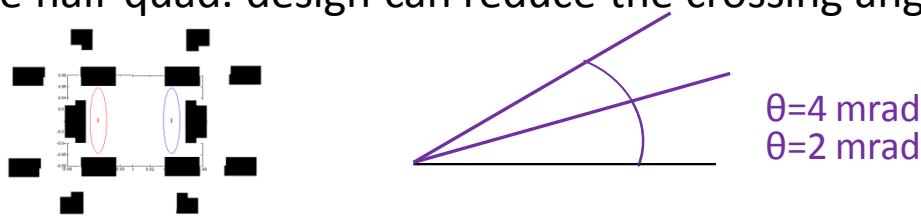

Luminosity gain

Luminosity in $10^{34} \text{ cm}^{-1}\text{s}^{-1}$

$\theta = 4\text{mrad}$

Nx10 ¹¹ \epsilon_n(μm)	3.75	3.5	3	2.5	2.2
1.15	0.6262	0.6721	0.7868	0.947	1.0776
1.5	1.0653	1.1435	1.3387	1.6111	1.8334
2	1.8939	2.0328	2.3798	2.8642	3.2594
2.5	2.9592	3.1763	3.7185	4.4753	5.0928
3	4.2613	4.5738	5.3546	6.4444	7.3336

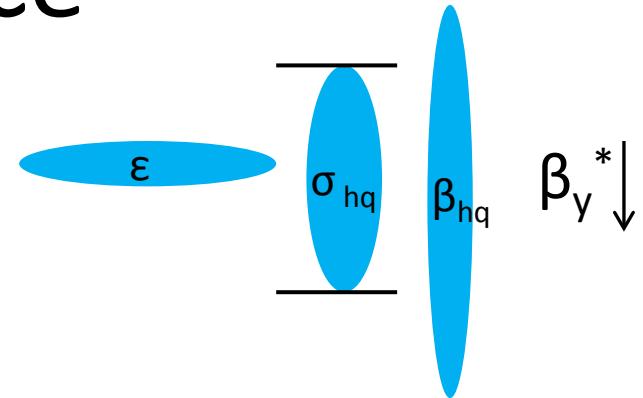

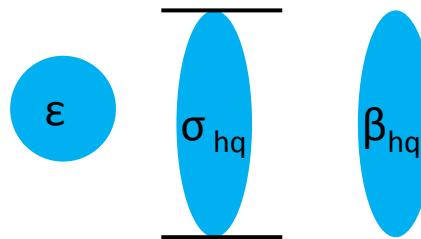

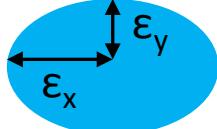

Main limitation: the crossing angle due to the separation of the double half quad
 Further improvements in the double half-quad. design can reduce the crossing angle (Nb_3Sn)

$\theta = 2\text{mrad}$

Nx10 ¹¹ \epsilon_n(μm)	3.75	3.5	3	2.5	2.2
1.15	1.1991	1.2938	1.5294	1.8563	2.1217
1.5	2.04	2.2012	2.602	3.1581	3.6097
2	3.6266	3.9132	4.6257	5.6144	6.4173
2.5	5.6666	6.1143	7.2276	8.7725	10.027
3	8.16	8.8046	10.4078	12.6324	14.4389

Flat emittance

Limitation: aperture of the half quad

Solution: reduce ϵ_y keeping constant $\epsilon_x \epsilon_y$

Squeeze of the emittance ellipse

β_y increase in the half-quad. -> reduction on $\sigma_y^* = \sqrt{\epsilon_y \beta_y^*}$

β_x decrease in the half-quad. -> reduction of horizontal chromatic aberrations

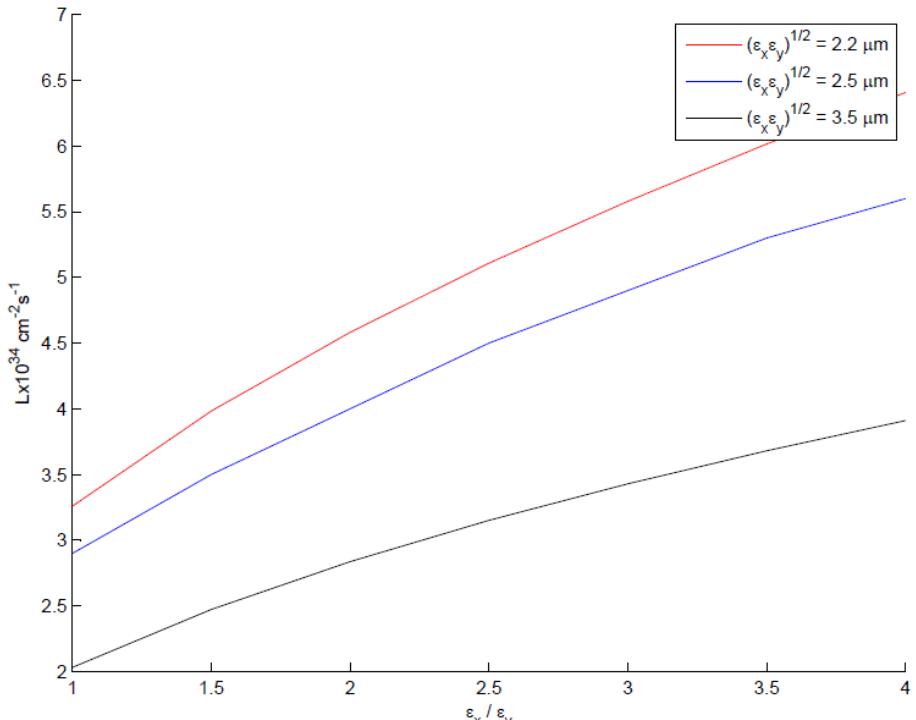

-> increase on $\sigma_x^* = \sqrt{\epsilon_x \beta_x^*}$

-> Geometric reduction factor increased $F = (1 + (\Theta/2)\sigma_z/\sigma_x)^{-1/2}$

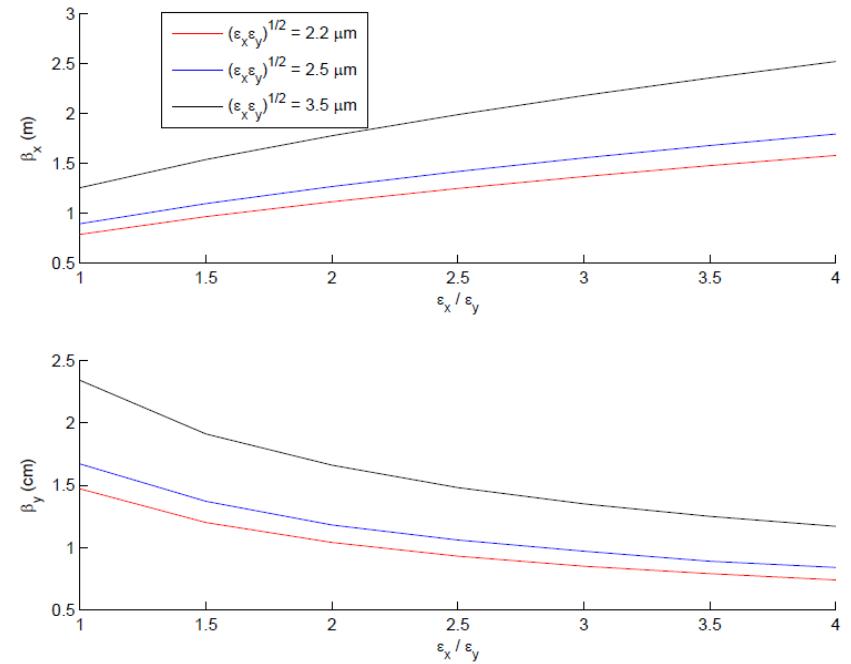

Luminosity increase through significant σ_y^* reduction and F increase

Flat emittance

Keep $\epsilon_x \epsilon_y$ and vary ϵ_x / ϵ_y
 $\Theta = 4$ mrad

Luminosity

Conclusions

- An extremely-flat beam optics is possible for LHC
 - Large Piwinski angle, to reduce the collision area and allow for a lower β_y decrease
 - Local vertical chromatic correction
 - Possibility to have crab waist collisions that can increase luminosity and suppress resonances
- The performance of the new optics can be improved
 - Future half-quad designs (Nb_3Sn)
 - Using a flat emittance
